

Help Desk Support Portfolio: Ticket Lifecycle Simulation & Remote Troubleshooting

Jorge Antonio Nava
July 2026- August 2026

Skills Demonstrated

- Hands-on lab project with ticket triage and prioritization
- SLA standard communication
- Active Directory account management
- Asset tracking
- Escalation procedure

ServiceDesk Simulation Report & Analytics- Lab Statistics

221pts, 91% accuracy, 16 tickets resolved

Lab Ticket #1 **ServiceDesk Simulation Lab**

INC0012871 **Critical**

Customer Support PC is completely dead, agent can't take calls

Reported by: Quinn Adams (qadams@servicedesk-simulator.com)

Department: Customer Support | Location: Floor 1

Contact: x2280

Issue Description:

My desktop on the Customer Support floor won't turn on at all this morning. No lights, no fan, nothing when I press power. I have a full queue of calls waiting and I can't do anything until I have a working machine.

Troubleshooting performed by user:

- Pressed the power button several times
- Checked the wall outlet with another device (it works)
- Completely dead, no lights, no fan, no beep

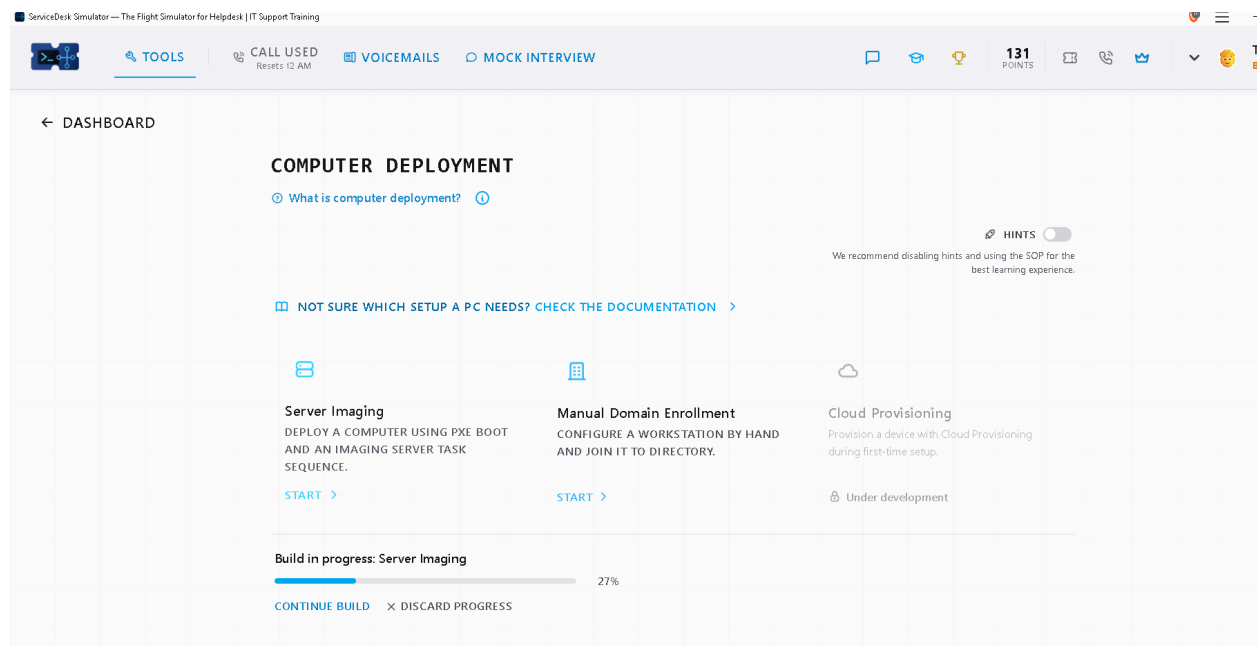

Business Impact:

Customer Support agent offline; calls queueing with no one to take them.

Documentation

The user submitted a ticket saying their desktop on the Customer Support floor won't turn on at all. There was no power, even when pressing the power button on. I confirmed if it's truly dead by having the agent try a good outlet or a different power cable, resulting in neither equipment to work.

Computer Deployment via Server Imaging

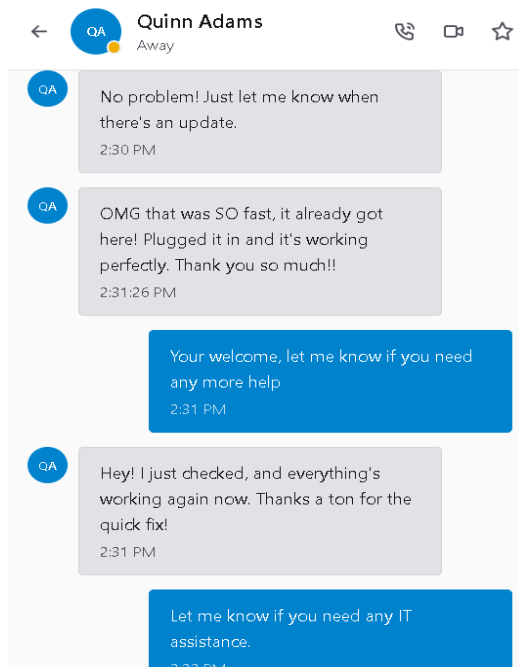

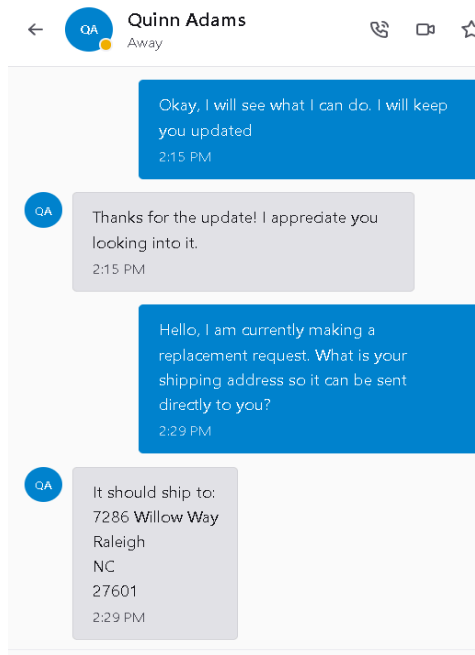

After identifying the issue, it is confirmed that the desktop's hardware was not working resulting in shipping a full desktop replacement. I deployed and built a new replacement with Server Imaging to choose the PC setup and ensured new desktop is properly tracked under asset management

Asset Management Tracking: Once a matching desktop computer is found, I created a shipping label for the new desktop replacement to be sent over to the user. Once desktop replacement was shipped, I confirmed to the user that the replacement is on their way.

Client confirmed desktop replacement was fully functional, ticket marked closed. I ensured to keep notes and documentation of this fix and to look over the documentation for future references.

A screenshot of a WhatsApp chat interface. At the top, the contact name is "Quinn Adams" with a status "Away". The chat shows three messages. The first message, from Quinn Adams (blue bubble), says: "Hello, I heard you are having issues regarding no power on your computer. Have you tried using a known good outelt and a different power cable? It might need replacing" followed by the timestamp "2:14 PM". The second message, from QA (gray bubble), says: "I haven't tried that yet, but honestly, I can't really check the cables myself. Can you just get me a replacement machine? I'm stuck here without a working computer." followed by the timestamp "2:14 PM". The third message, from Quinn Adams (blue bubble), says: "Is it a laptop or desktop?" followed by the timestamp "2:15 PM". The fourth message, from QA (gray bubble), says: "It's a desktop." followed by the timestamp "2:15 PM". The chat is set to "QA" and "Away" status is shown. The bottom of the screen shows a blue input bar.

Procedures

1. Gathered Essential Details

Gather ticket details such as name of the client, contact information, and system details. Made sure to include details regarding ticket, used details to determine asset ID of client's current workstation and replaced it for new desktop later in the process

2. Categorize the Issues, Set Priorities

Assigned ticket and categorized issue to critical since client needed workstation to be fixed as soon as possible.

3. Follow-Up Questions

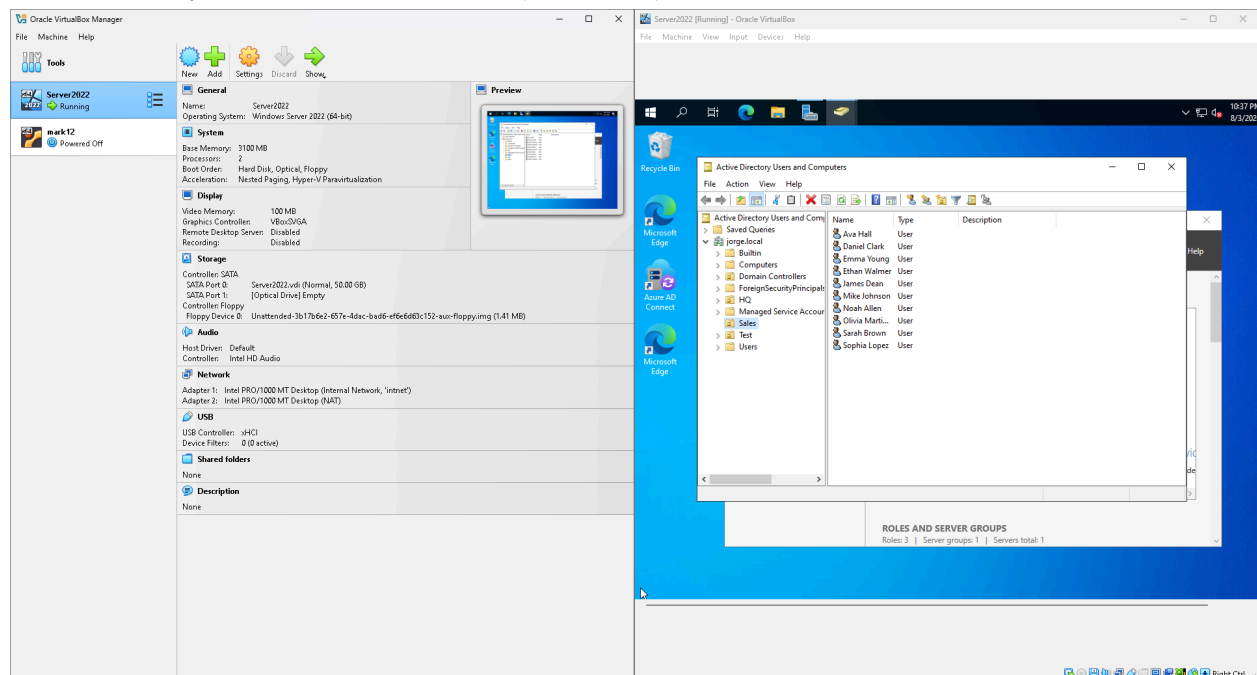

Communicated with the client and asked to verify cable or hardware functionality, later confirming a diagnosis. Asked questions to verify that the client needed full replacement of the desktop, created a shipping label and added a new Asset ID for the client's new desktop. No escalation was needed, client confirmed full functionality once replacement arrived.

Takeaway:

I made sure users felt comfortable to talk to me about their technical issues. I actively listened and asked questions that would help me identify the problem. After troubleshooting whether cable or hardware was the culprit, I found out the fan or light was not even on (meaning desktop itself is no longer functional).

I tracked and found the user's current Asset ID and found its desktop was offline, yet it was no longer functional even when trying to turn it on. The best course of action was to replace the computer for a new workstation and added new Asset ID for the desktop soon to be shipped
ServiceDesk Simulation provides Active Directory functionalities, similar to my Microsoft Active Directory home lab, which I have managed on virtual box via domain controller

Active Directory on Windows Server 2022 (VirtualBox)

ServiceDesk Simulator Active Directory

The screenshot displays the ServiceDesk Simulator Active Directory interface. At the top, there's a header bar with a 'TOOLS' menu, navigation links for 'VOICE CALL', 'VOICEMAILS', and 'MOCK INTERVIEW', and a user profile for 'TONZ87 BRONZE' with 131 points. Below the header, a 'DASHBOARD' section is visible. The main content area is titled 'DIRECTORY' and features a search bar for users. On the left, a list of users is shown, including Richard Harrison, Patricia Gonzalez, James Richardson, Sarah Johnson, Carol White, David Lee, and Tom Wilson. The central pane shows the 'GROUPS' section for Richard Harrison, listing group memberships: 'Domain Users', 'Management', and 'Executive-Access'. An 'ADD' button is present at the bottom of the group memberships list.

GROUP NAME	ACTION
Domain Users	
Management	X
Executive-Access	X

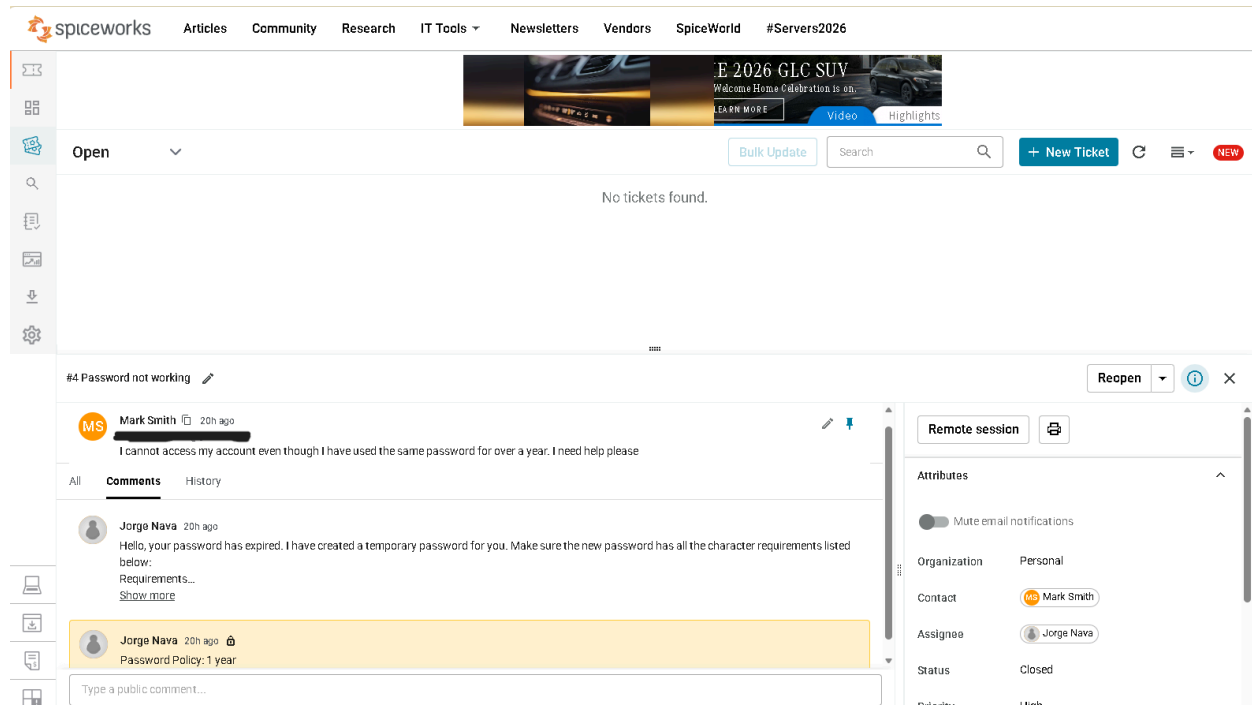

Add to group... ADD

The Active Directory on Windows Server 2022 works similar to the ServiceDesk Simulator except it provides far more functionalities and features. However, ServiceDesk Sim provides scenarios that closely aligns with enterprise-level troubleshooting

Lab Ticket #2

SpiceWorks Tutorials Recap

When creating a new ticket, it is crucial to prioritize which ticket has the highest priority to the least, ensuring adequate services and optimize ticketing services.

The simulated ticket above shows the end user has an expired password and cannot login to their account. It is important for the assignee to handle the ticket by effectively communicating with the end user, ensuring the user is being updated about the current issue they are facing.

Active listening and asking questions to the user are beneficial to understand the main cause of the problem, especially when the ticket can be vague.

To create a ticket, add:

- Organization (Company)
- Contact (Employee Ticket)
- Summary (Description of Issue)
- Assignee (User responsible for handling and resolving specific ticket)
- Priority (High, Medium, or Low)
- Category (Type of Issue)
- Attach File (Optional)

Simulated Ticket Creation: SpiceWorks allows you to create ticketing for IT professionals or help desk admins to look over and resolve the issue. Current assignee may be the person handling the ticket first, but it could be escalated to a new assignee if needed. Priorities may vary depending on severity or urgency of the issue such as hardware, software, or total system failure

Ticket Closure Checklist

Ensure tickets are properly resolved and documented.

Tasks:

- Confirm resolution with the user
- Update ticket notes
- Close the ticket with proper resolution code

#3 No internet connection on Computer01 Reopen

Jorge Nava 23h ago
Good afternoon, I am happy to help with your current technical issues. I will update the issue shortly, please be on hold.

Jorge Nava 23h ago
Hello again, I ran a quick speed test on the office Wi-Fi and everything is running efficiently. However, it seems that your computer is not on the network. Have there been any recent changes done to your computer settings? If so, I am happy to guide you step by step on the correct procedures.

Jorge Nava 20h ago
Quick Update: It seems that your computer's Internet gateway is misconfigured. Step-by-step instructions are provided to remediate this issue:
1. Press Windows + R...

Jorge Nava 20h ago
Let me know if the issue remains consistent

- After creating a ticket, contact the client and update them through ticket notes (Public comment). You need to tell the client that the issue should all be fixed and all set. Respond with, “Hello, your internet connectivity was caused by an IP misconfiguration. I can reconfigure your computer and will verify if the solution has been fixed”.
- Make sure that it's working for the user and verify full functionality, even if it's fixed. Tell the user to please check if the issue is no longer there. It is good to document simple issues such as WI-Fi disconnection or intermittent connectivity because we will know how to fix it in the future from our past documentation.
- Once the client has confirmed that the issue has been fixed, close the ticket. Ensure you have documented every single step you have done to fix the issue.

Escalation Lab Simulation

Objective: To understand when and how to escalate a ticket

Scenario: A user can't access the financial database. You've tried resetting log in credentials and basic network checks

Tasks:

- When to escalate
- To which team (ex: Database Admins)
- What info should be included when escalating

Users handling tickets cannot gain access to databases or modify company databases. Sometimes tickets need to be escalated to an employee/ department with higher privileges

The screenshot shows the Spiceworks ticket management interface. At the top, there's a navigation bar with 'Open' status, a 'Bulk Update' button, a search bar, and a '+ NEW' button. Below this is a table of tickets with columns: ID, Summary, Assignee, Creator, Organization, Priority, Category, and Status. The first ticket is ID 5, 'Cannot access Financial Database', assigned to Jane Doe, created by Mark Smith, in the 'Personal' category with 'Medium' priority. Below the table, the details for ticket #5 are shown. It includes a list of actions: 'removed Software from category.' and a comment from Jorge Nava (0s ago) stating 'changed assignee from Jorge Nava → Jane Doe.'. Below this, another comment from Jorge Nava (0s ago) is highlighted with a red rectangle. The comment reads: 'Hello, I'm escalating this ticket to your team. The user's account is AIDENK009 and they need read-only access to Mark Smith's account. Thank you and let me know if you need anything else.' At the bottom, there's a text input field for a public comment, a 'Send' button, and a dropdown menu.

Example: This simulated ticket was escalated to 'Jane Doe' and let users know it has been escalated to another team.

- You assign a ticket to a higher level IT department who has escalated privileges.

- Users will see that you are escalating this ticket and let users know you are escalating so they can expect that it's a different team that will be helping them.
- Users will create a generic ticket and it is up to different teams to assign it to the appropriate teams
- It is important to know that once the ticket has been escalated, the first assignee must still stay on the line. Ensure client and assignee are able to communicate and remain on standby if further assistance is required on your end.

Additional Features: Similar to Zendesk macros, SpiceWorks Cloud Help Desk can create a canned response which creates automated messages to respond to generic questions/ answers from users.

The screenshot displays the SpiceWorks Cloud Help Desk interface. At the top, there's a navigation bar with links like Articles, Community, Research, IT Tools, Newsletters, Vendors, SpiceWorld, and #Servers2026. The main content area shows a list of tickets. The selected ticket is '#5 Cannot access Financial Database', assigned to Jane Doe, created by Mark Smith, and is currently Open with a Medium priority. The ticket details section shows a comment from Mark Smith asking for help to gain access to a database. Below this, a comment from Jorge Nava explains the escalation to the IT team. At the bottom, a red circle highlights the 'Public comment' input field with the text 'Good afternoon, I am happy to help with your current technical issues. I will update the issue shortly, please be on hold.' and a 'Send' button.

- Once the ticket is escalated, you can communicate to the team through Internal Note. These comments will only be visible to your department, not the user.
- Added internal note to communicate with escalated IT team, ensure client and escalated team are in contact and to standby if further assistance is required.

SpiceWorks Report: During each step of the ticketing process, I was able to perform the IT Ticket Lifecycle

- Categorization
- Prioritization
- Routing/ Assignment

- Status Update

Takeaway:

- The benefits of using the ticket triage allows the assignee to perform faster resolution times, optimize workflow, and remain consistent with customer satisfaction.
- Communication and patience is the key component in dealing with end users, ensuring that the assignee is able to provide resolutions in good time while upholding SLA standards.
- The purpose of this lab simulation is to understand the process of a ticket lifecycle in an enterprise environment.
